- Game development is the most challenging thing to make
- When something is confusing you got to go back to what you already know
- Start with classes before vars or action
- Class tells you how something is created which has vars and functions
- The var and functions control logic
- Class is blueprint
- Python is object oriented
- Game Engines always have IDE even in Unity
- Unity uses Visual Studio and uses C# in unity
- C# is connected to the .NET framework also is C++
- OS operating system
- How to program a way of thinking
- Unity created its own WPF
- Unity has prefab that can solve issues that VS cannot
- Unity was made around the game loop meaning something is always updating
- Prefab gives you reference to your assets inside of your folder
- Prefab make 1000 of examples but only uses one reference
- Objects are references
- Objects can have function and other classes integrated in it
- This. is a C# term that goes before most code but doesn't show on the code
- Public property allows outside sources to access your properties but not directly
-
